We met on the third floor of Thinkbox on Saturday, October 24, 2026, at 5:30PM. Andrew, Martin, and Aryan were present.

Andrew finished a Solidworks model for a third revision of the Prototype 3 device casing and began printing it.

Aryan and Martin reorganized the wires on the breadboard so that wires for each device could be bundled together for cleaner management. Andrew used some heat shrink to insulate the solder joints on the buzzer module.

When the 3d print was done, we went to Glennan lab to clean the 3d print (remove temporary supports). We then used electrical tape to organize wires further and attach components securely onto the casing.

We brought the device into the Glennan lounge to test and record footage.

Adjourned at 8:00PM.
