We met on Wednesday, October 21, 2026, at 2:00 PM in Glennan Lab. Andrew, Aryan, and Martin were present.

We cut some paper to shape and attach onto the sound sensors in an attempt to isolate each sound sensor's detection to a specific direction. This will hopefully prevent a sound sensor from detecting noises from directions which it's not facing.

Aryan and Martin worked on trying to test possible insulations for the microphone to improve isolation of sound sensing in a single direction.

We moved to Thinkbox to begin designing a casing for the prototype. Aryan and Martin drew schematics of a prototype casing while Andrew set up Solidworks and began creating the 3-D model.
