We met in Glennan lab on Wednesday, October 14, 2026, at 2:05PM. All members were present.

We received our microphones today, so we began making preparations to test them.

Andrew soldered some breakout pins to the Adafruit I2S Mic (http://adafru.it/6049). Meanwhile, Aryan, Adewola, and Martin began testing the analog sound sensor (DFR0034: https://wiki.dfrobot.com/dfr0034/).

The three members working on the sound sensor connected the sensor to the ESP32 and observed outputs to determine how the device works.

Aryan made a GitHub repo for the team so that we can easily work on shared files. Martin and Andrew each pushed the code that they had written for OLED & sensor testing. We created a folder to work on merging our code together for a revised prototype.

Aryan and Adewola began developing code to test the function of the buzzer.
