We met on Friday, October 16, 2026, at 2:00 PM, in Glennan Lab. All members were present.

We each worked on various parts of working with the individual components which will be used in our device. Martin worked on connecting the sound sensors to the OLED and displaying an image, while Aryan, Adewola, and Andrew worked on communicating with the microphone module.

We were successfully able to display an image on the OLED based on the signals from two sound sensors, establishing a baseline for the final goal of establishing an absolute direction by attaching more sensors.

We were also able to successfully get data from the microphone module, but we will need more testing to understand this data and work with it in real time for displaying appropriate signals on the screen.

Adjourned at 3:10 PM.
