We met on Wednesday, October 7, 2026, at 3:00 PM in Glennan lab. All members were present.

We began by planning how to create our first prototype. During class, Aryan found a cardboard box with which to make a low-fidelity prototype, so we used some scissors to cut the box into shape so that we could arrange it into our watch format. We used a stapler to connect the cardboard pieces together to try and mimic the bulk we would expect from actual components so that we can figure out the sizing of the device.

After we completed our first prototype, we began constructing a circuit to start our second prototype. Andrew had already used the OLED screen in Lab 5 and the circuit was still constructed, so we used that circuit and code as a basis for running the screen.

We created bitmaps to represent the arrows that will display on the screen in response to sound signals. We plan to connect a sensor to this circuit, such as a joystick or potentiometer, to test controlling these arrows dynamically.

When our microphones arrive, we will use them to begin building our mic array.

Adjourned at 4:30 PM.
